RESEARCH PROPOSAL TITLE

Beauty to Action

RESEARCH PROBLEM AND RELEVANCE

Beauty plays a crucial role in UX/UI design, influencing user feel, trust, and decision-making. The extent to which aesthetic appeal directly affects user actions, however, such as click-through rates, retention, or task completion, remains underexplored. I would like to measure how perceived beauty in digital interfaces correlates with user behavior, offering insights for designers on optimizing aesthetics for usability and efficiency while maintaining aesthetic.

This project is relevant because with increasing competition in digital products, companies must balance aesthetics with usability to maximize engagement and conversions. While designers intuitively prioritize aesthetics, there is little quantifiable data on how users' perception of beauty translates into measurable outcomes.

RESEARCH QUESTION(S)

How does the perceived beauty of a user interface correlate with user actions such as engagement time, task completion, and interaction frequency?

METHODS / TECHNOLOGIES

Survey

☐

EDA

☒

EEG

☒

EYE TRACKING

☒

OTHER

EXPERIMENTAL TASKS

Participants will interact with interface designs of varying aesthetic appeal. The study will use a within-subjects design where each participant experiences different interface versions (selected at random) and performs tasks such as navigation, data input, and decision-making. User behavior metrics (time spent, task success rate) will be recorded alongside physiological and survey data. Survey data will include perceived beauty, perceived experience, and likelihood of returning.
